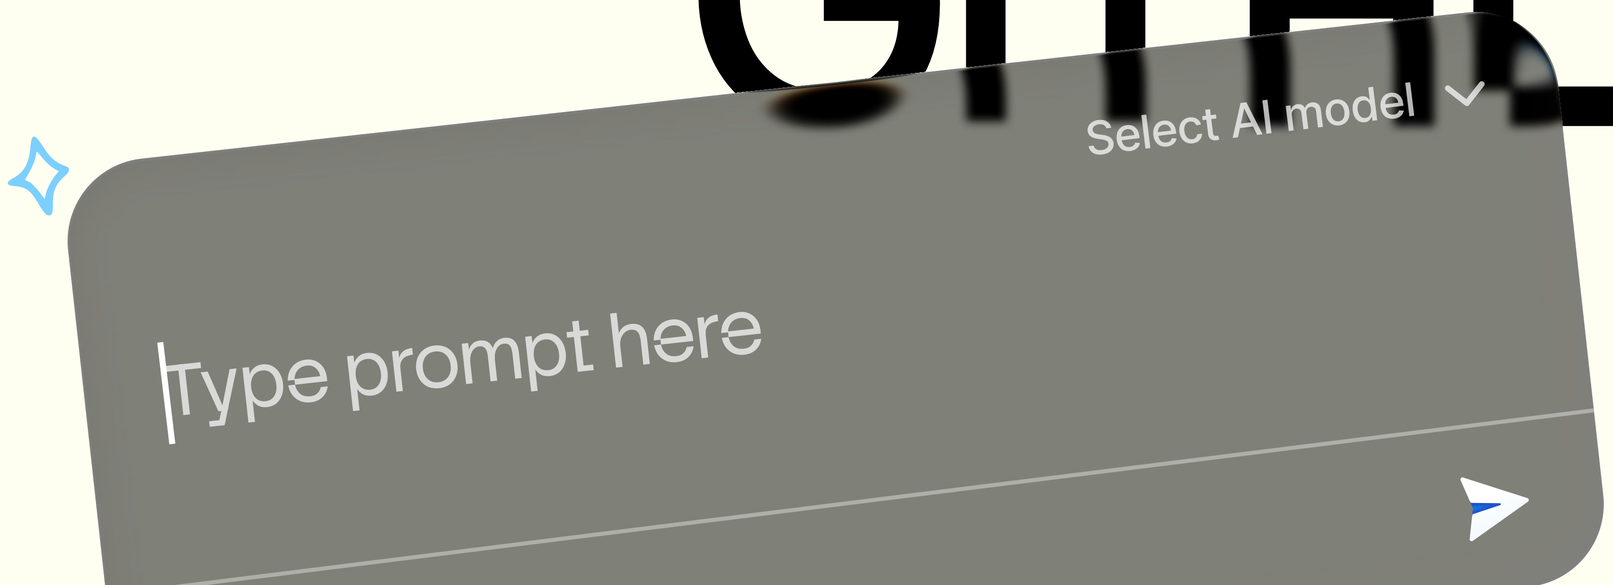
FROM AI TO GITHUB



NUGI FARHAN
SENIOR PRODUCT DESIGNER

I'm here because I enjoy bridging the gap between design theory and the messy, fast-paced reality of the industry. Having served as a UX Advisor for programs like Bangkit, DBS CodingCamp and BI Hackathon, I can help you move beyond just "making things look good" and start thinking like a product strategist.

Experience

Hi! I'm Nugi

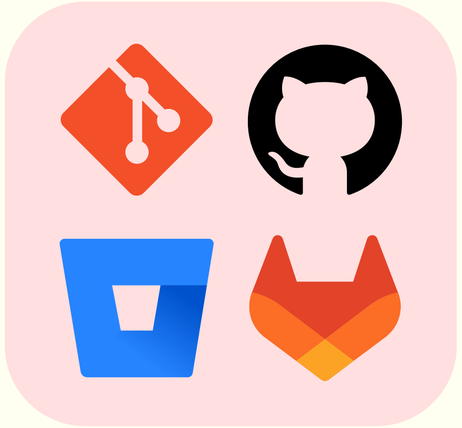
Membuat dan mengembangkan



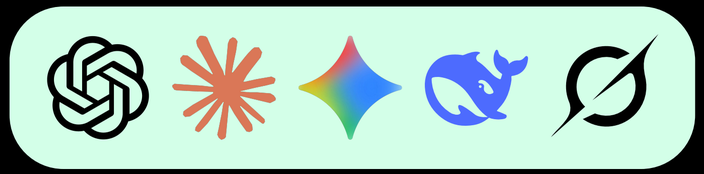
Manajemen perubahan dan kolaborasi

Objektif kita hari ini

1. Dapat menjelaskan bagaimana prompt AI yg lebih spesifik dapat menghasilkan hasil yg lebih baik
2. Dapat mengidentifikasi repository, commit, branch, dan pull request.
3. Dapat membedakan apa itu git dan github
4. Dapat melakukan version controlling

>_PROMPT ENGINEERING

Cara merancang instruksi agar AI memberikan jawaban
yang tepat, relevan, dan layak untuk digunakan.



Prompt adalah instruksi atau masukan yang Anda berikan kepada model untuk mendapatkan hasil tertentu.

Bentuknya bisa beragam, mulai dari pertanyaan sederhana, kata kunci, hingga instruksi yang rumit, atau potongan kode.

```
Create student task planner
```

Without context

```
You are helping me build a beginner-friendly student task planner as a simple web application.

## Goal
Create a task planner that helps first-year university students keep track of assignments and deadlines.

## Requirements
... cont

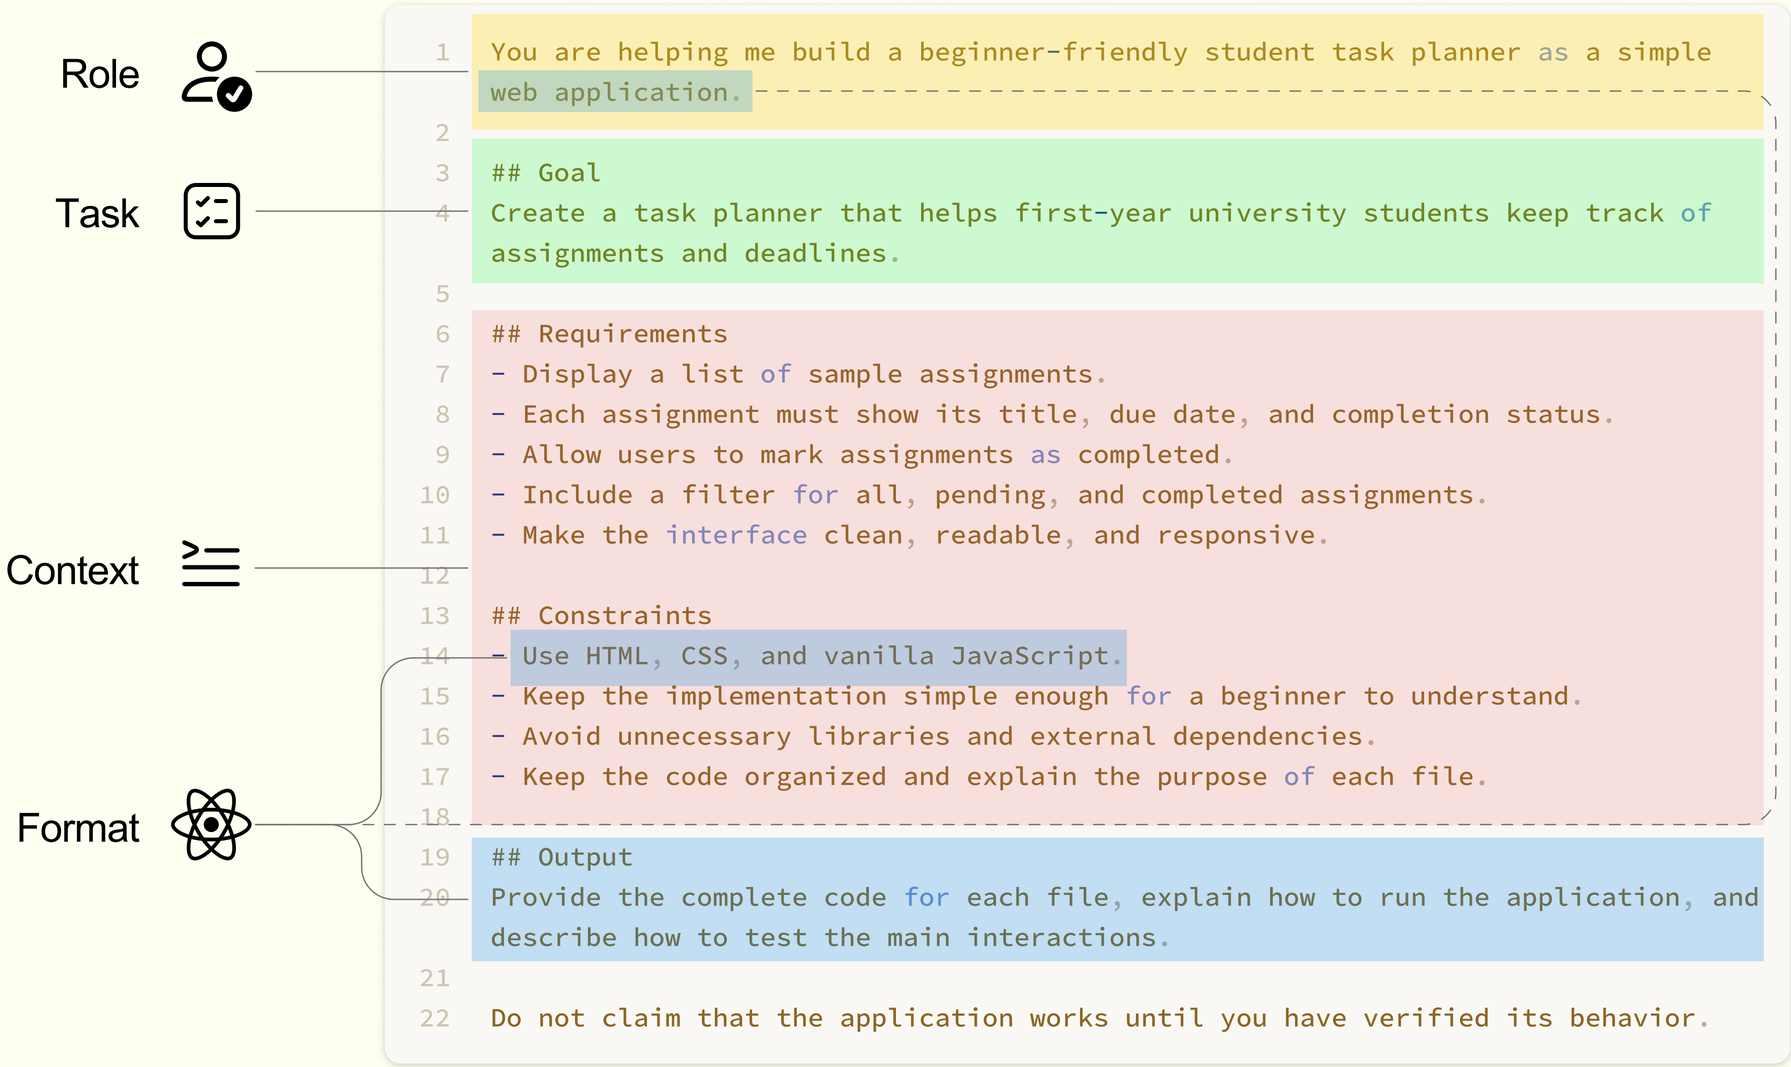
Format



Role
Task
Context
Format
1 You are helping me build a beginner-friendly student task planner as a simple web application.
2
3 ## Goal
4 Create a task planner that helps first-year university students keep track of assignments and deadlines.
5
6 ## Requirements
7 - Display a list of sample assignments.
8 - Each assignment must show its title, due date, and completion status.
9 - Allow users to mark assignments as completed.
10 - Include a filter for all, pending, and completed assignments.
11 - Make the interface clean, readable, and responsive.
12
13 ## Constraints
14 - Use HTML, CSS, and vanilla JavaScript.
15 - Keep the implementation simple enough for a beginner to understand.
16 - Avoid unnecessary libraries and external dependencies.
17 - Keep the code organized and explain the purpose of each file.
18
19 ## Output
20 Provide the complete code for each file, explain how to run the application, and describe how to test the main interactions.
21
22 Do not claim that the application works until you have verified its behavior.

Tactic	Prompt example
Use action verbs to specify the desired action	"Write a bulleted list that summarizes the key findings of the attached research paper"
Define the desired length and format of the output	"Compose a 500-word essay discussing the impact of climate change on coastal communities."
Specify the target audience	"Write a product description for a new line of organic skincare products, targeting young adults concerned with sustainability."

Tactic	Prompt example
Include relevant facts and data	"Given that global temperatures have risen by 1 degree Celsius since the pre-industrial era, discuss the potential consequences for sea level rise."
Reference specific sources or documents	"Based on the attached financial report, analyze the company's profitability over the past five years."
Define key terms and concepts	"Explain the concept of quantum computing in simple terms, suitable for a non-technical audience."

yg lebih baik

Git/HUB

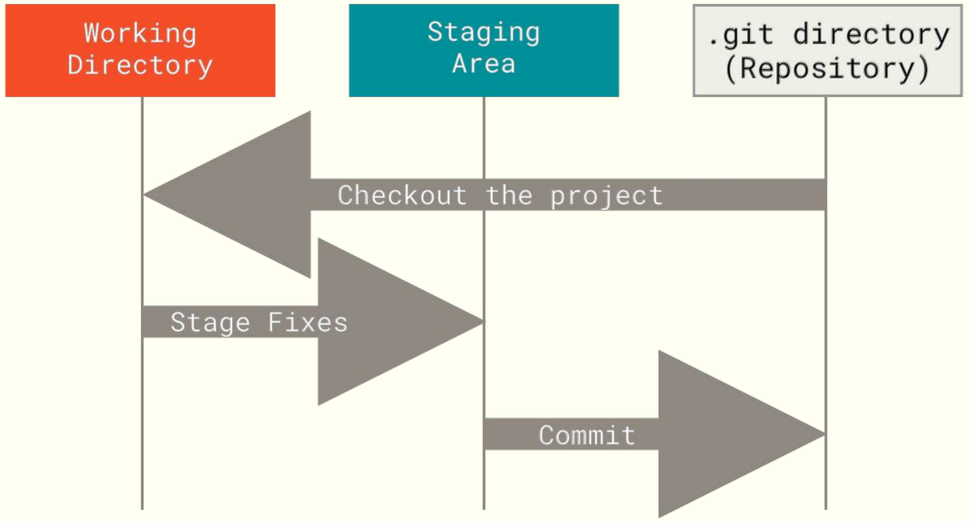
In case of fire

1. git commit
2. git push
3. leave building

Git adalah *version control system*—yang melacak siapa, kapan, dan apa saja yang sudah dirubah dalam suatu file

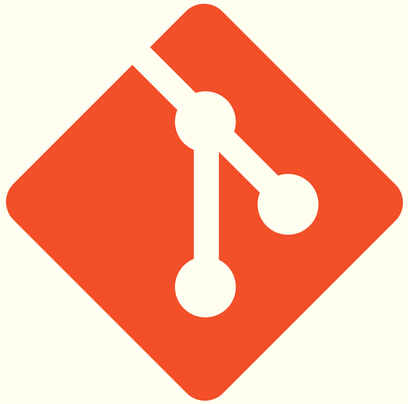
Git diciptakan oleh Linus Torvalds pada tahun 2005. Alat ini dirancang untuk mencatat setiap perubahan yang terjadi pada file. Codepolitan.com

Working directory/tree adalah salinan dari satu versi proyek yang sedang kamu kerjakan. File-file di dalamnya diambil dari database yang tersimpan di direktori Git, kemudian ditempatkan di komputer agar dapat digunakan atau dimodifikasi.



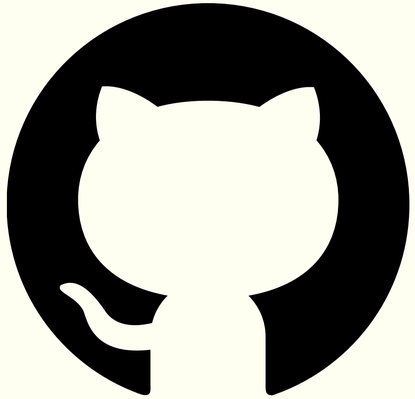
Git directory adalah tempat Git menyimpan metadata dan object database dari sebuah proyek. Bagian ini merupakan komponen terpenting dalam Git karena berisi seluruh informasi yang dibutuhkan Git untuk mengelola proyek. Ketika kamu melakukan clone repository dari komputer lain, bagian inilah yang akan disalin.

Staging area adalah file yang umumnya berada di dalam direktori Git dan berfungsi untuk menyimpan informasi mengenai perubahan apa saja yang akan dimasukkan ke dalam commit berikutnya. Dalam istilah teknis Git, staging area disebut sebagai index.



Sistem version control terdistribusi (DVCS) yang digunakan untuk melacak dan mengelola perubahan kode secara lokal.

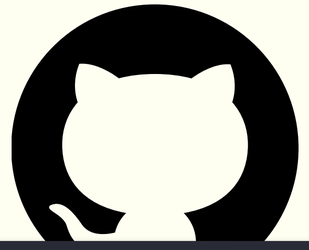
Git



Platform berbasis web yang digunakan untuk menyimpan repository Git secara online dan mendukung kolaborasi.

Github

```
1  git init
2  //Memulai repo baru
3
4  git add.
5  //Memindahkan file ke staging area
6
7  git commit -m 'message'
8  //Menyimpan file ke Repository.
```



```
1  git remote add <name> <url>
2  //Add untracked file or unstaged changes
3
4  git push origin main
5  //Push the current branch to its remote
   "tracking branch"
6
7  git pull origin main
8  //Fetch changes and then merge them into
   your current branch:
```

1. Install Git → Search google “install git”
2. Pilih versi yang sesuai dengan device kamu
3. Buka terminal/cmd → type

```
git --version
git version 2.xx.xx
```

4. Setup git identity

```
git config --global user.name "Your Name"
git config --global user.email "your-email@example.com"
```

5. Check config

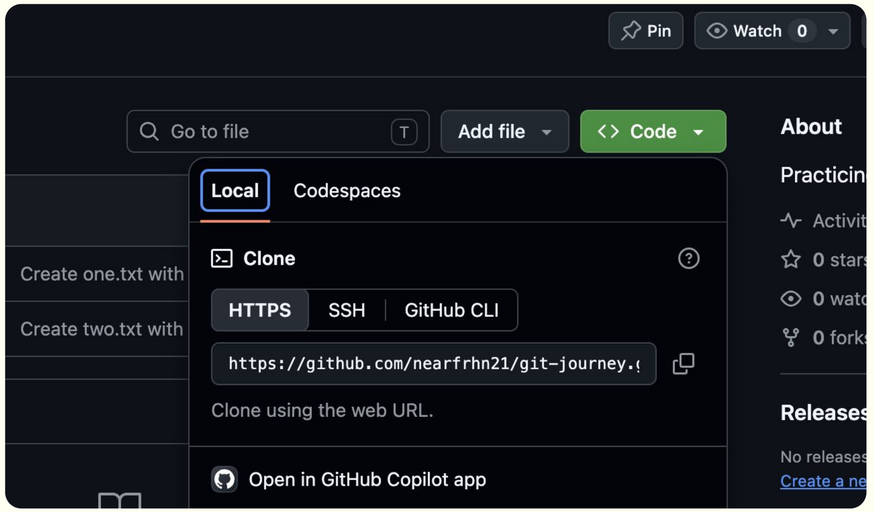
```
git config --global --list
```

1. Install VSCode
2. open VS Code
3. Hit Command+Shift+P / Ctrl+Shift+P
4. Search for Shell Command: Install 'code' command in PATH.
5. Open terminal type code --version

```
git init
```

Or

```
Open github
Create new repository
Open Code dropdown button
On the local, copy the link file
//type in your terminal
git clone "url"
```



```
1    git add --all
2    git add -A
3    //above behave the same way, it works to add everything
     inside the repositoryt to stagingarea
4
5    git add .
6    //add all file on the repository and every file inside it
     staging area
7
8    git add *
9    //add all modified or new files, but not the deleted one
```

```
ssh-keygen -t ed25519 -C "email@domain.com"
```

1. When prompted for file location (Enter file in which to save the key (/Users/usename/.ssh/id_ed25519):), press Enter to accept the default.
2. When prompted for a passphrase, enter a secure passphrase (or press Enter twice for no passphrase).

Ed: Stands for EdDSA (Edwards-curve Digital Signature Algorithm). It is an asymmetric cryptographic signing algorithm based on a specific family of mathematical curves known as Edwards curves.
25519: Refers to the underlying elliptic curve called Curve25519, created in 2011 by cryptographer Daniel J. Bernstein.
In short, Ed25519 is an elliptic curve signature scheme designed to offer high security, high performance, and protection against common cryptographic implementation attacks.

```
//1. Start the SSH agent: (bash)
eval "$(ssh-agent -s)"

//Open or create ~/.ssh/config: (bash)
touch ~/.ssh/config

//Add the following host configuration
open -e ~/.ssh/config or nano ~/.ssh/config
//copy and paste this text
Host github.com
  AddKeysToAgent yes
  UseKeychain yes
  IdentityFile ~/.ssh/id_ed25519

//Add the key to ssh-agent and store the passphrase in macOS Keychain:
ssh-add --apple-use-keychain ~/.ssh/id_ed25519
```

```
// run in your terminal to copy your SSH key
pbcopy < ~/.ssh/id_ed25519.pub

//Add the key to GitHub
Navigate to GitHub SSH and GPG keys settings
1. Click New SSH key.
2. In the Title field, enter a descriptive label (e.g., MacBook).
3. Leave Key type as Authentication Key.
4. Paste your copied key into the Key field.
5. Click Add SSH key.

//verify the connection
ssh -T git@github.com

//you should see this message
Hi username! You've successfully authenticated, but GitHub does not provide shell access.
```

```
//1. Check Git
git --version

//2. Check Git identity
git config --global user.name
git config --global user.email

//3. Check VS Code
code --version

//4. Check GitHub connection
ssh -T git@github.com
```

Let's build something simple.

STUDENT TASK PLANNER

1. Install AI assisted platform (claude, antigravity, chatgpt)
2. Write prompt to create your web/apps
3. Add to git by git init
4. Commit and Push to GitHub
5. Make changes
6. Commit and Push to GitHub

ThANKYOU
